PARKING SERVICE PROVIDER OF THE YEAR

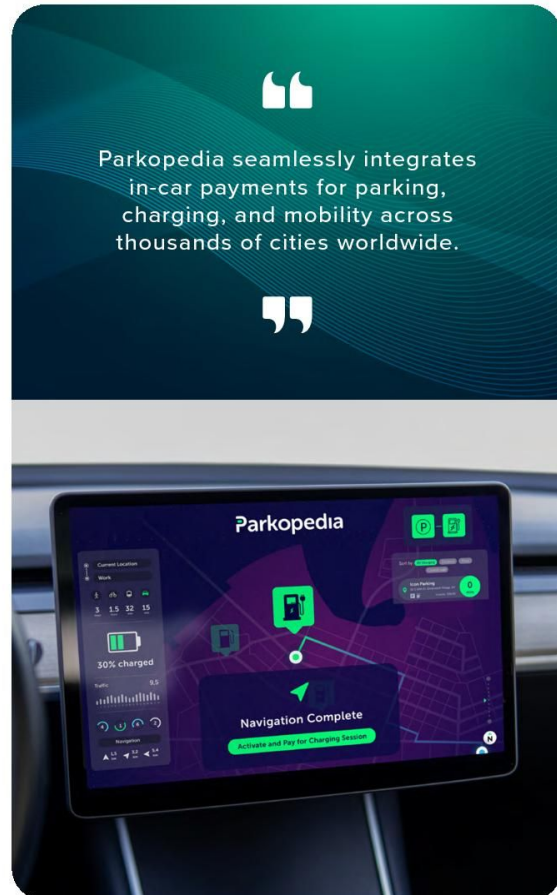

Parkopedia

Parkopedia is the world's leading connected car services provider, enabling drivers to find and pay for parking, EV charging, fuelling, and tolls across 20,000 cities in 90 countries. Leveraging advanced technologies – including proprietary software, computer vision, and artificial intelligence – the company delivers a seamless experience directly through vehicle infotainment systems. Its single sign-on, in-car payment platform consolidates multiple payment providers into one secure interface, allowing drivers to activate and pay for services from within their vehicles. Parkopedia works with a global network of expert partners to ensure broad coverage and maintain the highest standards of data accuracy, supporting millions of users worldwide.

Over the past year, Parkopedia has achieved numerous key milestones, reinforcing its leadership in connected car services. Its acquisition by Arrive merges digital parking and transactions expertise with Parkopedia's in-car technology and vast EV charging network. This strategic union enhances urban mobility and streamlines parking, charging, and payment experiences for drivers. Parkopedia also recently expanded partnerships with various automakers, offering seamless in-dash features. MINI's latest OLED display integrates Parkopedia's real-time EV charging data, while Kia's CarPay enables parking payments from within the vehicle across Europe, combined with expansions in Asia, with on-street parking services via the rapidly growing Chinese automaker, NIO. The launch of Parkopedia's multi-contract Plug and Charge solution sets a new standard for secure, automated EV charging. Collaborations with ChargeHub and Regeny have added thousands of charging locations in North America and the Middle East. These achievements highlight Parkopedia's ongoing commitment to innovation, global reach, and smarter mobility solutions.

The judging panel was particularly impressed by Parkopedia's standout approach to seamless in-car connectivity, which integrates parking, charging, and payment services directly into vehicle infotainment systems. By removing the need for multiple apps, external payment methods, or separate accounts, Parkopedia simplifies the user experience, allowing drivers to access and pay for services effortlessly from within their vehicles. The feature enables EV drivers to authenticate and pay for charging automatically, without the need for RFID cards or numerous apps.

“Parkopedia seamlessly integrates in-car payments for parking, charging, and mobility across thousands of cities worldwide.”
